

XINFO

JCL and Procedures

For years, batch production has been predicted to come to a close end. In reality, the number of batch programs is constantly increasing and every new online system needs the integration of further maintenance, archiving and batch runs.

With ISPF utilities like editor, search function or file list JCL can be created and maintained, for further analysis to programs, files, DB2 tables etc. there is no sufficient support in ISPF.

In which jobs is file X.Y.Z used?

Which jobs don't have an ACCOUNT parameter?

In which jobs is the program ABC used?

In which jobs are files deleted with IDCAMS steps?

Which jobs use DB2 table X?

XINFO - The IT Information System

Even simple questions like "In which jobs is file X.Y.Z used", "Which jobs don't have an ACCOUNT parameter?" or "Which jobs use DB2 table ABC?" can't be answered or only with complex searches.

XINFO analyses all production joblibs, the PROCLIBs, SYSIN statement and even more. A comprehensive cross-reference enables the search for jobs, programs, files as well as all other JCL parameters.
